Cristie Backup Solution

Be sure, restore!

Recovery Assurance

Be in control of your backups, recoveries and automated tests, with real time information, progress checks and validated compliance reporting.

Recovery Assurance allows you to perform a bare machine recovery of your operating system, applications and data direct from an IBM Spectrum Protect backup. The recovery is fast and can be fully automated to protect your critical systems from the consequences of physical damage, human error or system failure. You can recover your protected systems to any point in time provided by Spectrum Protect.

Simulated recoveries can be scheduled which fully automates the creation of the recovered machine and then runs test scripts to verify integrity and functionality. Recovery schedules can be set up

months in advance and planned so that the entire server infrastructure is tested within the desired time frame. The recovery machines are held in an isolated network and can be released after every simulation so storage is not permanently required.

Detailed reporting of each step of the recovery process highlights any problems encountered and provides an audit trail of successful results to provide assurance that DR procedures are effective.

Recovery Assurance is a bundle of Cristie TBMR and Cristie Virtual Appliance.

OS Support
We support Windows, Linux, AIX and Solaris operating systems.

Dissimilar Environments
With our unique dissimilar environment technology, you can recover to any physical, cloud or virtual environment.

Automation
No manual recoveries, we support fully automated recoveries.
